Description

The EP1202 series is a group of positive voltage output, three-pin regulators, that provides a high current even when the input/output voltage differential is small. Low power consumption and high accuracy is achieved through CMOS and programmable fuse technologies.

The EP1202 consists of a high-precision voltage reference, an error correction circuit, and a current limited output driver. Transient responses to load variations have improved in comparison to the existing series. SOT-23(150mW) package is available.

Functional Block Diagram

Functional Description

A minimum of $10\mu F$ capacitor must be connected from V_{OUT} to ground to insure stability. Typically a large storage capacitor is connected from V_{IN} to ground to ensure that the input voltage does not sag below the minimum dropout voltage during the load transient response. This pin must always be 0.7V higher than V_{OUT} in order for the device to regulate properly.
